Moving between the two

What this deliberately does not do

What good looks like

A guide for the Consumer Relations Manager. What was built, why it works the way it does, and how to use it to run ST3 through ST7.

WHAT THIS IS

University activation was, until now, kept in meeting notes and in your head. Which advisor agreed to send the flyer, which chapter shared it, when the job posting was last checked, whether anyone had asked about professors yet. That worked at four universities. It does not work at forty.

The workspace turns that into a record. Two new tabs sit in the MedJobs In Basket:

- **Universities** shows every campus and the state of its five channels.
- **Tasks** holds the follow-up work the system generated for you.

The design principle behind it is worth stating plainly, because it explains almost every decision below: **you record what actually happened, and the system works out what it means.** You will not find a status dropdown anywhere. You tick off real steps, and the status follows.

THE FIVE CHANNELS

The channels are unchanged from the operating model. What is new is that each one now has a written definition of what makes it live, and the system holds you to it.

	Channel	Live when
ST3	University job board	The posting is submitted, approved, and confirmed visible to students
ST4	Advisor listserv	The advisor has agreed to send the flyer to their listserv
ST5	Student organizations	At least one organization is activated
ST6	Campus events	At least one event or webinar is activated
ST7	Professors and class outreach	Approval obtained, and at least one professor has agreed

ST3 and ST4 are single switches. They are either arranged at this university or they are not.

ST5, ST6 and ST7 are lists. A campus can have four student organizations, two events and nine professors, each activating on its own schedule. Adding one is a button; each one keeps its own contacts, its own history and its own next check.

NOT YET, IN PROGRESS, LIVE

Every channel and every record moves through the same three states, and you never choose them.

Not yet is where everything starts. Nobody has done anything.

In progress happens automatically the moment you tick the first step.

Live happens automatically when the last required step is ticked. The system stamps the date, shows a brief acknowledgement, and creates your next follow-up.

There is one state you do choose: **not available here**. Use it when a channel genuinely cannot work at this university, and say why. A dead job board recorded as dead is useful. A dead job board left blank looks like work nobody did.

Records inside the list channels can be **declined** in the same way, for the organization that says no or the professor who is not interested. A declined record stops appearing as unfinished work.

Activation is recorded once and never removed. If a channel later goes quiet, the date it first went live stays on the record. It did happen, and that fact does not expire.

RUNNING THE LIST

Open **Universities**. Every campus is a row, and the five channels read left to right in the same order every time. A **red dot** beside a university name means something there is due or overdue.

Work top down. Universities with a red dot sort first, so when the dots run out, you are done for the day.

Click a university to open it. You will see its five channels, each collapsed to one line: the status, how far along it is, and the date it is next due. Click a channel to open its workflow. Click a date to jump straight to the task that explains what to do.

WORKING A CHANNEL

Inside a channel you will find the same six things every time, in the same order.

Live win is the checklist. Tick what has actually happened. Each tick records the date automatically, so you never type one.

Contacts default to the university advisor, because they are usually the right person. Where the real contact is someone else, a career services officer for the job board, an events office for a fair, add them.

Suggested email and call script are there where the step involves asking someone for something. They are short on purpose. A partner who has to edit is a partner who does not send. Edit them freely and copy them out; the workspace does not send mail.

Next check is the one open follow-up. Click it and you land on the task.

History is collapsed until you want it, with the count on the toggle. Add a note whenever something happens that the checkboxes do not capture.

Mark not available here sits at the bottom, and asks for a reason.

THE THREE LIST CHANNELS

ST5, student organizations. Add each organization by name. Each one is live as soon as its leadership agrees to any one meaningful way of reaching members: sharing the flyer in a group chat, emailing it out, or arranging a presentation. One is enough. Each live organization gets its own monthly reconnect.

ST6, campus events. Add both kinds: webinars we host and university events we join. An event is live when five things are true, a leader identified, host approval obtained, a date scheduled, a presenter assigned, and collateral ready. The same five work for a webinar and for a career fair. This channel also carries a **semester review**, which arrives on its own so that nothing sits unlooked-at for a term.

ST7, professors. This one is gated. **You cannot add a professor until approval is recorded**, because we do not prospect faculty until a university has told us we may. Record who can give that permission, then record it when it arrives. The list unlocks then, and not before. Once a professor agrees, either to pass the opportunity on or to let us join a class, they are live and come back to you seasonally.

TASKS

Everything recurring is created for you. You never pick a task type from a menu.

Task	Appears when	Comes back
Confirm posting still live	ST3 goes live	Monthly

Task	Appears when	Comes back
Confirm advisor agreed to distribute the flyer	You record sending the advisor the flyer	Once, after 7 days
Remind to send copy to listserv again	ST4 goes live	Monthly
Reconnect to maintain distribution	An organization goes live	Monthly, per organization
Semester review of event opportunities	ST6 is first opened	Each semester
Event day	An event date is scheduled	Once
Re-engage professor	A professor goes live	Seasonally, per professor

Open a task and it tells you what it is, why it matters, who to contact, the steps, and what done means. Where the task is a message, the draft is there to copy.

Two kinds of button appear at the bottom, and the difference matters.

Mark done closes a routine check and schedules the next one at the right interval. If you could not do it this cycle, **Skip this cycle** moves it on without claiming you did.

Yes, they agreed appears on the one task that asks a question rather than setting a chore. Answering it ticks the box back in the university record. The task and the checklist are the same fact, so they cannot end up disagreeing. **Not yet, ask again** pushes it out a week and leaves the box alone.

Custom tasks are for work the five channels do not describe. Give it a name, a date, and your own checklist of what needs doing.

MOVING BETWEEN THE TWO

Every path goes both ways.

A next-check date in a university opens that task. A task names its university and channel as a link back. A red dot anywhere leads to the item that caused it. You can start from either tab and never reach a dead end.

WHAT THIS DELIBERATELY DOES NOT DO

It does not send email. It does not assign work to anyone, because one person runs this today. It does not report on which channel produced a student, because we cannot yet measure that honestly and a plausible number would be worse than none. It does not detect a channel that has quietly gone stale.

Those are choices, not omissions. Say so if any of them starts costing you real time.

WHAT GOOD LOOKS LIKE

A university that is working properly has channels that are live and dates that are in the future. Not five live channels: a campus with a dead job board and no faculty access, honestly recorded, is in better shape than one with five blanks.

The stage does not close. Every other stage in the funnel ends in an outcome. This one ends in a standing commitment: postings expire, officers graduate, a fair moves, a listserv only sends when someone asks. Each channel is two motions, secure it once and then keep it alive, and the second is what decides whether a university produces students in the spring as well as the autumn.

The workspace exists to make the second motion ordinary daily work rather than something to remember.
