

MedJobs 2.0 Master Implementation Matrix

Stage by stage: user journey, procedure, system handoff · 4 September 2026

CONTENTS

PR1: Target list built and pre-flight complete	ST8: Student application submitted
PR-OUT: Outbound work	QUAL: Portal vets the application
PR2: Provider meeting held	MA1: Candidate intro
PR3: Client success	MA2: Interview held
ST1: Target advisors	MA3: Hire confirmed
ST-OUT: University outbound	MA4: Six or more shifts worked, confirmed
ST2: Advisor meeting held	MA5: Bill issued and collected
ST3–ST7: University activation	

One university and the providers around it. Two pipelines built in parallel, each handed from the Admin Team to the Sales Lead at the booked meeting, and from the Sales Lead to the Consumer Relations Manager after it. Both feed the Portal, which carries a student from application to a placement we can bill for.

Each stage below is set out in three layers: what the user does and what the technology does, the procedure behind it, and what the system records and hands on. Anything the document describes that does not exist yet is named as such and carried in the deferred build list at the end.

PR1: TARGET LIST BUILT AND PRE-FLIGHT COMPLETE

Objective Add a university site so the system loads every matching provider from the Olera directory into the In Basket, then complete pre-flight research on each one (phone, email, address, decision maker) confirmed by a pre-flight call.

- **Owner** Admin Team.
- **Users** Admin Team.
- **Completion criteria** Contact details confirmed on the call, and the row launched into outreach, or three unsuccessful call attempts, and the row archived.

PR1 is not just the list. It is the list *built and worked through pre-flight*. A site whose providers are loaded but un-researched has not completed PR1.

① USER JOURNEY / TECHNOLOGY

Actor: Admin Team. Two screens carry the whole stage.

#	What they do	Where	Exhibit
1	Open the Sites tab and review active university territories	olera.care/admin/medjobs/sites	A
2	Click + Add Site and pick a university. The picker shows how many directory providers fall in that service area, and that is how many Provider Prospects the site will generate	Same page, Add Site modal	B
3	Go to the In Basket, Providers tab. The site's providers are waiting there for pre-flight research	olera.care/admin/medjobs/in-basket	C
4	Open a provider row. The drawer holds the research panel (business name, phone, email, address, fax, contact form, decision makers, research notes) with Fill from Website and a source link	In Basket → provider drawer	E
5	Click Call to Confirm , work the suggested script, and log the outcome	Drawer → Log Pre-Flight outcome modal	D
6	Launch outreach once contact details are confirmed	Drawer → Launch outreach →	E

What the system does on its own: adding a site pulls the matching providers out of the Olera directory and places them in the In Basket as rows awaiting pre-flight research. Nobody builds the list by hand.

The one row that is built by hand. The directory cannot supply a provider it has never carried, so an agency heard about on a call would otherwise have nowhere to go. The providers list on the Tasks board ends with **Add a provider**, which starts a record from a name alone. It joins the site on the same first rung as every other provider and is worked identically; it simply carries no directory row behind it.

② PROCEDURE

For a given site, work every provider on it.

1. **Do the desk research first.** Fill in whatever phone, email and address you can find yourself, from the provider's website, the source link on the row, or **Fill from Website**. Do not call a row you have not looked at. On the Tasks board this desk pass is a rung of its own, named **Research**, and it is ticked on the record rather than logged as a call. Four things have to be true before it is ticked:

Pre-flight. One call, four outcomes, and the three-strike rule that closes a row nobody answers.

Check	Against what
The name is the name the agency trades under	Their own website
The website opens and is theirs	Their own website
The phone number reaches them	Their own website
The address is within a 60-minute drive of campus	Google Maps directions, not straight-line distance

A provider outside the 60 minutes is archived here, before anybody calls it. The catchment radius is a net, not a judgement: it is measured as the crow flies and cannot see a mountain, a lake or a freeway.

2. **Call every provider on the site.** The call confirms the research; research alone does not complete pre-flight.
3. **Use the suggested script** shown in the log modal: *"Hi, this is [your name] from Dr. DuBose's office, calling about the Student Caregiver Program for [University] students. I'd like to send your team an email with the details, and wanted to check first on the best address to send it to."*
4. **Log the outcome, every time.**

Outcome	What it means	What happens to the row
Confirmed contact info	Reached someone; email and decision maker verified	Pre-flight passes: launch outreach
No answer	Nobody picked up	Stays in pre-flight: call again
Voicemail	Message left	Stays in pre-flight: call again
Not interested	They do not want the information	Row closes; no outreach

5. **Update the record from the call.** A corrected email address or a named decision maker learned on the phone goes onto the row immediately, while you have it.
6. **Three attempts, then archive.** If three calls fail to confirm the contact details, archive the provider and move on.

The modal also carries an Override & launch outreach escape hatch for a row you are confident about without a confirming call. Use it deliberately, not as the default.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Business name · phone · email · address · fax · contact form · decision makers · research notes · call outcome and notes	loaded → in pre-flight → confirmed · archived · closed	site added · providers loaded · contact added or updated · pre-flight call logged (confirmed / no answer / voicemail / not interested) · outreach launched · archived	Contact details confirmed on a call	Launch outreach → PR-OUT. Not confirmed → the row stays in pre-flight for another attempt. Three failed attempts → archived

Every call, including the ones nobody answered, writes to the row's timeline with the caller's name and the time, so the attempt count is visible rather than remembered.

Communications None outbound at this stage. The pre-flight call is the only contact, and it uses the script in the log modal.

EXHIBITS

Exhibit A. Sites. Active university territories, each card carrying its research badges (**Research needed** · Advising ✓ · Orgs ✓ · Dept heads □), a stakeholder count, and **Find partners** ✦. olera.care/admin/medjobs/sites

Exhibit B. Add Site. The university picker, each option carrying its catchment count, *University of Houston / Rice, 152 in catchment*. **This is where the size of the prospect list is decided.** Picking a university with 152 providers commits the Admin Team to pre-flying 152 rows. olera.care/admin/medjobs/sites → **+ Add Site**

Exhibit C. In Basket, Providers tab. The day's workload over three counters: **QUEUED**, **LOGS COMPLETED TODAY**, and a **STREAK** of consecutive business days hitting fifty logs. Below, one card per provider, filtered to a single site, under tabs that each carry a worked/total count. olera.care/admin/medjobs/in-basket

Exhibit D. Log Pre-Flight outcome. The **SUGGESTED SCRIPT** verbatim, the four outcomes with their consequences written underneath each, a notes field prompting "What did they confirm? Anything useful for outreach copy?", and **Override & launch outreach**. In Basket → provider row → **Call to Confirm**

Exhibit E. Provider drawer. RESEARCH states the sequence ("Check the info, call to confirm, then launch outreach") over five contact fields, each with a state marker. The ticks are what pre-flight complete looks like on a row. Then **DECISION MAKERS**, three actions (**Call to Confirm** · **Launch outreach** → · **Launch activation** →), research notes, and the timeline. **The timeline is where the three-strikes count is read from:** one entry per attempt, with the operator's name and how long ago. In Basket → provider row

PR-OUT: OUTBOUND WORK

Objective Launch the call-and-email campaign on a provider that has cleared pre-flight, then work the queues it generates until the provider books a meeting or the row runs out.

- **Owner Admin Team.**
- **Users Admin Team, provider.**
- **Completion criteria** A meeting on the Sales Lead's calendar, or a recorded terminal outcome, or a finished cadence that drops the row into Follow-up.

The cadence is shorter than the protocol says. Graize's written protocol calls this the *D0–30 campaign*. What is shipped is **3 emails and 2 calls over 7 days:** Day 0 · Day 3 · Day 5 · Day 7. Either the protocol or the cadence should change; flagged rather than reconciled.

① USER JOURNEY / TECHNOLOGY

Actors: Admin Team and the provider. Launch happens once; the queues are worked daily.

#	What happens	Where	Exhibit
1	Click Launch outreach → on a cleared row. Confirm outreach plan opens with the whole campaign laid out: a launch summary, the recipients as checkboxes, and every day expandable to the actual email the provider will receive	In Basket → provider drawer	E, F
2	Start outreach. Day 0 sends; the rest queue via the send engine	Automatic	None
3	Work the Calls tab: calls grouped by the day they are due, each row with a click-to-dial number	olera.care/admin/medjobs/in-basket?tab=calls	G
4	Open the row. The drawer's NEXT STEP panel names the state and offers the actions that fit it	Calls → row	I
5	Call provider , work the day's script, log the outcome	Row → Log call	H
6	Check replies. Check for reply shows the provider's actual message and the ways to respond	Emails → row → Check for reply	J
7	When a cadence finishes with no meeting, the row appears in Follow-up for triage	In Basket → Follow-up	None

The cadence. Day 0 intro email · Day 3 follow-up email and a check-in call · Day 5 call · Day 7 final email. Cold email sends from a dedicated outreach domain. Scheduled sends and calls appear in the drawer's **UPCOMING** list with their dates, so the row's whole future is visible before it happens.

OUTREACH, 7 DAYS

- Day 0 ● Intro email
- Day 3 ● Follow-up email
Check-in call
- Day 5 ● Call
- Day 7 ● Final email

A reply stops the sequence

The outreach cadence. Three emails and two calls over seven days, and any reply ends it.

② PROCEDURE

- Launch only rows that cleared pre-flight.** The override writes itself to the timeline with your name on it. Use it deliberately.
- Read the plan before starting.** Untick anyone who should not receive it, and expand Day 0 to check the merge fields resolved.
- Work the Calls tab to zero every day.** Calls are grouped by due date; the count beside the date is the day's workload.
- Read the NEXT STEP panel before dialling.** It tells you where the row actually is: awaiting reply, next call in N days, or they replied and it is your move.
- Use the day's script.** A Day 3 call opens with a different line than a Day 5 one.
- Answer every reply within one business day:** same day for anything mentioning a time.
- Log every outcome, every time,** including the calls nobody answered. A note on its own logs the call.
- Do not hand-email a row mid-cadence.** Reply through the row so the cadence stops cleanly.

Call outcomes and what each does to the row

Outcome	What happens
Interested	They want to move forward: launches the activation sequence
 Meeting booked	Opens the Calendly booking page and marks a meeting scheduled
No answer	Marks this call done; the next cadence call stays scheduled
Voicemail	Message left; the next cadence call stays scheduled
Not interested	Closes the row and cancels remaining outreach

Reply handling: what each option does

Option	What happens
Launch activation cadence	Runs the standard activation sequence toward a meeting
 Launch custom cadence	Compose your own emails and calls for a bespoke response
 OOO reply: restart last cadence	Auto-reply, not a real answer. Resumes the cadence and puts the row back to pending
 Book a meeting	Opens the Calendly booking page and marks a meeting scheduled
Not interested	Sends a polite closing note and stops outreach

A real reply stops the cadence automatically. The timeline records *"Reply received to [address] cadence stopped,"* so the next move is a manual one. The out-of-office option exists precisely because an auto-reply should not count as one.

On the Tasks board the first ask is interest, not a meeting, and the whole of a follow-up round happens on one screen.

Step one is *check their email and your voicemail*: both, because a provider who rang back and got the machine has got back to us and the board would never know. Under it sit the two acts a silent round is: **call them** and **email them, resending the programme**, each with the way to do it to hand and a tick. The log button cannot be pressed until both are done, and then it logs two acts. It used to say *No reply*, which named something the provider had not done and recorded nothing that we had.

The other three outcomes sit beside it, on the same screen, with one free-text box for what happened.

Outcome	What it means	Where the record goes
Log the call and the email	Nothing back, both done	The next round, two business days out
Interested, start onboarding	Yes, tell me more	Send the onboarding pack , today
Not interested	They declined	Archived
Something else	Anything the first three do not cover	A task in the operator's own words, on the day they pick

Something else is the honest fourth outcome. *Send it to our corporate office. Talk to our RN manager. Call me back in March when we budget. We need a W-9 first.* There is no list of those and there never will be, so the board takes one at a time: what needs doing, in the operator's words, and the day it comes back. The queued task carries that sentence as its own title, so a queue of them reads as work rather than as four rows saying *Something else*. It ends the way the reply did: a yes goes to the pack, no answer either way restarts the follow-up block, another thing to do queues another one, and a no archives.

There is no longer a *warm but not now* outcome. Once the ask is interest rather than a meeting, interested-later is interested: they get the pack, and the onboarding block does the chasing. The rung that used to hold that state is where *Something else* now sits.

Interest can be logged wherever it arrives, including on the confirming call: a provider who says yes on the phone skips the programme email and the whole block rather than being followed up to arrive where they already are.

The pack is the email that means nobody has to explain it again. Three things: how the programme works end to end; what they are looking for in a caregiver, which they can simply reply with and we will set up on our side; and the pilot terms, attached for review. It carries their portal link, and the rung cannot be logged without it: but the portal is offered, not required, because a provider who would rather reply in prose is the normal case for this audience, not the exception.

The email states no price. The attached terms describe the pilot: nothing to sign, no obligation, students until a hire works out, and formal terms agreed afterwards rather than now. See **C1**, and **D-011** and **D-012**, which between them say why the number lives in the attachment and not in the email: and why putting it in the attachment is itself a decision about C1.

"Not yet" is not offered on a rung that already runs on a cadence. Putting a follow-up off by two days is what the next round is. It stays on the confirming call, the programme email, the pack, the set-up check and the meeting.

Then onboarding, which is chasing one sentence. The pack ends by asking for it: *reply and tell me you are ready to receive your first student and you are clear on what happens when one arrives*. If anything is unclear they reply with the question instead, and we answer it by email.

Onboarding follow up 1–7 is the same screen as the cold block, because it is the same act: check their email and your voicemail, and if nothing has come back, call and email again. Three days apart rather than two, because they have already said yes. At the fourth round the rung says to ask straight out on the phone, or to offer to set their profile up with them there and then, rather than sending the same thing a fifth time.

It never archives. After the seventh round it keeps going on the same cadence. Seven unanswered cold calls is a no; seven unanswered nudges at a provider who has already said yes is not, and losing them over scheduling would be the worst outcome in the funnel.

Ending	What it means	Where the record goes
Log the call and the email	Nothing back, both done	The next round, three days out
They are ready	They have said so	The goal: nothing further
Booked a call to help	They would rather be walked through it	Help them on a call , on the day
Not interested	They have changed their mind	Archived
Something else	Anything the other four do not cover	A task in the operator's own words

A call is a tool, not a stage. *Help them on a call* is a branch, reached only when somebody books one, and most providers never see it. It is fifteen minutes doing whatever is stopping them, usually setting their

requirements in the portal while you are on the phone, and it ends the same way every other screen does: they are ready, or they are not yet and it goes back to chasing.

The goal is an acknowledgement, not an event. *Ready for their first student* is not a rung anybody ticks; it is where the ladder stops when a provider says they understand how students reach them and what to do when one arrives. A call, an email and a meeting are all ways of getting that sentence, and none of them is required.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Recipients launched · sends, opens, replies · call outcomes and notes · scheduled sends and calls	researched → outreach sent → cold · replied · closed · cadence finished	outreach launched · row moved from Researched to Outreach Sent · outreach email sent (with open state) · called, no answer / voicemail / reached · reply received, cadence stopped · pre-flight overridden	A meeting is booked	Admin Team → Sales Lead. The row appears in the Meetings queue with its full timeline. No meeting and the cadence finishes → the row drops to Follow-up for re-engage-or-retire triage

A **state chip** above the timeline reads the row's position without anyone reading its history, *Cold, 1 email sent, never opened · awaiting their callback, or Replied: your move.* **UPCOMING** lists what is still scheduled; **PAST ACTIVITY** what happened, each entry stamped with the operator and how long ago.

Opens, replies and bounces only reach these queues if the send engine's webhook is wired. Without it the Emails and Follow-up tabs look empty rather than broken.

Communications Day 0 intro email · Day 3 follow-up email · Day 3 check-in call · Day 5 call · Day 7 final email · the reply the provider sends back.

EXHIBITS

Exhibit F. Confirm outreach plan. **LAUNCH SUMMARY** ("3 emails + 2 calls"), **RECIPIENTS** as checkboxes with the address and phone each will be reached on, and **CADENCE** with every day expandable. Day 0 opens to the full email: To, From, subject, the body the provider will see, the variables substituted, and the program PDF. In Basket → provider drawer → **Launch outreach** →

Exhibit G. Calls tab. Calls grouped by due date with the day's count beside it, each row carrying the provider, its contact type, its site, and a click-to-dial number. `olera.care/admin/medjobs/in-basket?tab=calls`

Exhibit I. The drawer during outreach. NEXT STEP names the state, "Awaiting reply · Next call in 4d", over the actions that fit it. Below, the state chip, UPCOMING (queued emails and scheduled calls with dates) and PAST ACTIVITY. Calls → row

Exhibit H. Log call. The day's script at the top, *DAY 3 SCRIPT*, then the five outcomes with their consequences, and a notes field where a note on its own logs the call. Calls → row → **Call provider**

Exhibit J. Check for reply. The provider's actual reply quoted at the top, then the five ways to respond. Behind it, the **Emails** tab grouped by state: *THEY REPLIED* (9). olera.care/admin/medjobs/in-basket?tab=replies → row → **Check for reply**

PR2: PROVIDER MEETING HELD

Objective Hold the meeting, convert the provider, and capture what was promised.

- **Owner** Sales Lead.
- **Users** Sales Lead, provider.
- **Completion criteria** Outcome logged and the relationship handed to the Consumer Relations Manager.

① USER JOURNEY / TECHNOLOGY

#	What happens	Where	Exhibit
1	Someone books the 30-minute slot (usually the Admin Team, live on a call or off a reply that names a time	Calendly) Student Caregiver Program	L
2	The booking lands the row in Meetings , under NEEDS LOGGING once the time has passed: "log the outcome to move the row forward"	olera.care/admin/medjobs/in-basket?tab=meetings	M
3	Open the row. NEXT STEP reads "On the calendar" with a single action, and the state chip reads "Replied: they replied · meeting booked"	Meetings → row	N
4	Hold the meeting, then Log meeting outcome . The modal confirms what was booked and who attended, then offers three outcomes	Row → Log meeting outcome	N

Booking is an Admin Team action first. The operator putting it in the calendar during the call is the design. Sending the link and waiting is the slower fallback.

"Finding a time" is a holding state, not a meeting. The Admin Team sets it while a provider is going back and forth by email. Ideally the Meetings tab would hold only booked meetings. See the deferred list. Left as-is for now.

② PROCEDURE

1. **Read the row before the call.** The timeline shows every email, reply and call that produced this meeting, including what they said when they replied.
2. **Run the standard structure** and close with the soft agreement ask: *no rush to sign, we just need it before you interview your first student.*
3. **Log the outcome the same day.** A meeting held and unlogged is a row that stops moving.
4. **Write down what was promised** in the notes: a note on its own logs the meeting.
5. **Rebook a no-show once, warmly.** The option opens Calendly for you; people miss meetings.
6. **A no-show that cannot be rebooked goes back into outreach.** It is not a decline. The row should re-enter a call-and-email sequence rather than sit in Meetings or close. See the deferred list.

Meeting outcomes and what each does to the row

Outcome	What happens
Interested / went well	Logs the meeting and launches the activation sequence
No-show / reschedule	Logs a no-show and opens Calendly to rebook. <i>Ideally, a no-show that is not immediately rebooked drops the row into a fresh call-and-email sequence, not yet built</i>
Not interested	Sends a polite closing note and stops outreach

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Booked time · attendee name and address · outcome · notes and commitments	engaged → meeting scheduled → converted · closed	meeting scheduled: row moved to Meetings · meeting held · outcome logged · activation launched	Outcome logged	Sales Lead → Consumer Relations Manager. <i>Interested / went well</i> launches activation and moves the relationship on; the other two close the row

Communications Booking confirmation and reminder from Calendly · the post-meeting details email with the agreement · a polite closing note when the answer is no.

EXHIBITS

Exhibit L. The booking page. What the provider sees: **Student Caregiver Program**, 30 minutes, the Sales Lead's name, and the pitch: *hands-on caregiving hours, recommendation letters, and experience that strengthens their med, PA, and nursing applications*, over a date and time picker. `calendly.com/.../home-care-agency-manager-interview`

Exhibit M. Meetings tab. **NEEDS LOGGING** carries meetings whose time has passed: *"log the outcome to move the row forward."* **FINDING A TIME** below it holds rows still coordinating by email, a state the Admin Team sets by hand. The tab count reads worked over total. `olera.care/admin/medjobs/in-basket?tab=meetings`

Exhibit N. Log meeting outcome. A **BOOKED** panel confirming the calendar entry and the attendee, then the three outcomes with their consequences, and a notes field. Behind it the drawer shows **NEXT STEP · On the calendar** and the state chip "*Replied: they replied · meeting booked*", over a timeline that runs back through every reply and send. Meetings → row → **Log meeting outcome**

PR3: CLIENT SUCCESS

Objective Carry the provider from the meeting to a first hire: profile updated, terms understood, account set up and ready for the first student to arrive.

- **Owner** Consumer Relations Manager.
- **Users** Consumer Relations Manager, provider.
- **Completion criteria** Profile updated · terms email sent and acknowledged · setup meeting held · the account ready to receive a candidate.

Almost none of this is built. PR3 runs by hand today. The block below describes how it should work; every missing piece is on the deferred build list at the end of this document. Nothing here is blocked on that. It is blocked on someone doing it consistently.

WHAT CLIENT SUCCESS IS

The ongoing relationship function, from the moment a provider converts. It is not onboarding, which ends, and it is not support, which waits to be asked. It is one person owning the client from the meeting through the first hire and every hire after: the profile, the terms, the account setup, the interviews, the placements, the six-shift threshold, the invoice, and the next staffing need.

One role holds it across both sides of MedJobs. Chantel is the Consumer Relations Manager today.

① USER JOURNEY / TECHNOLOGY

#	What happens	Where	Built?
1	The Sales Lead names the handoff in the meeting: <i>"our consumer relations team will follow up with you on next steps."</i> The provider leaves expecting the next contact, and expecting it from someone else	In the meeting	Manual
2	Logging the meeting outcome alerts the Consumer Relations Manager that a converted provider is waiting on them	None	Not built: B4
3	They read the whole record before making contact: the outreach history, what they said in the reply, the meeting notes and anything promised	Provider drawer timeline (Exhibit N)	Exists
4	They send the terms email: more detail on how the program works and what it costs	Email, by hand	Manual

#	What happens	Where	Built?
5	They get the profile updated: what a good caregiver looks like here, shifts needed, headcount	Provider portal · chased by hand	Partly
6	They book the setup meeting for the next week or two	Calendly, by hand	Manual
7	The setup meeting happens: the account is configured and ready for the first student	In the meeting	Manual
8	Everything after this is recorded against the client (every meeting, touchpoint, interview, hire, six-shift confirmation, invoice)	None	Not built) B5

② PROCEDURE

- 1. The Sales Lead names the handoff in the room.** A warm introduction to a named function beats a cold email from a stranger a week later.
- 2. Read the record before you write.** The meeting notes tell you what they asked for and what was promised. Opening with something they said is the difference between a follow-up and a form letter.
- 3. Send the terms email within one business day of the meeting,** while it is still fresh for them.
- 4. Land three things, in this order:** profile updated · terms understood · setup meeting booked. Chase each until it is done rather than sending one email and waiting.
- 5. Book the setup meeting one to two weeks out.** It is the readiness check: the last chance to catch a half-finished account before a student is looking at it.
- 6. Write down every touchpoint.** Until the client record exists, keep it on the row so the history stays in one place.
- 7. Do not hand a client to the marketplace until the account is ready.** A provider looking at candidates with an incomplete profile gets bad matches and blames the matching.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Terms sent and acknowledged · profile answers and demand profile · setup meeting held · every touchpoint after conversion	converted → active client, account ready	handoff received · terms email sent · profile completed · setup meeting held · client note added	The account is ready and a staffing need is recorded	Consumer Relations Manager → the Portal. The staffing need drives matching; the client stays theirs from here on

Communications The post-meeting terms email · profile reminders · the setup meeting invitation · everything after it, from the same person.

EXHIBITS

None. There is no client success surface to photograph yet: the work happens in email, in Calendly, and in the provider row. **B4** and **B5** are what would make this stage visible.

ST1: TARGET ADVISORS

Objective Produce a verified list of university offices for a site, each with the email outreach needs, waiting in the In Basket to be confirmed by a call.

- **Owner** Admin Team.
- **Users** Admin Team.
- **Completion criteria** Offices generated as prospects, each verified and tagged, waiting in the Partners tab.

The office is the prospect, not the person. An advising office with an email is what outreach needs. Named advisors are optional, and worth adding only when they have their own contact details. The opposite of provider prospecting, and deliberate: offices outlast the people in them.

① USER JOURNEY / TECHNOLOGY

Three subtypes are worked in turn for each site: **Advising** → **Student orgs** → **Departments**.

#	What they do	Where	Exhibit
1	On the site card, click Find partners ✦: "Find partners with AI for this university"	olera.care/admin/medjobs/sites	O
2	Step 1 · Find offices. Suggest links proposes office pages; predefined searches open Google and check themselves off as you go; anything found by hand can be pasted in. Pre-health advising first, then nursing and allied, then career services	Research modal	P
3	Step 2 · Verify offices. Each office gets a name, a tag , an email, a phone, an optional website, then a Verified tick. Advisors can be added underneath, but only with their own email or phone	Research modal	Q
4	Step 3 · Generate. The verified offices become prospects in the In Basket, then Continue to Student orgs → , and later Departments	Research modal	R
5	The offices appear in the Partners tab, each showing its university and its tag	olera.care/admin/medjobs/in-basket?tab=partner_book	S

The site card tracks progress across the three subtypes, **Advising** ✓ · **Orgs** ✓ · **Dept heads** □, with **Research needed** until the first one is done. The wizard autosaves as you work.

② PROCEDURE

1. **Work one site through all three subtypes** (advising, then orgs, then departments) rather than half-finish several sites.
2. **Use Suggest links first, then the predefined searches.** They cover the ground without your keeping a list in your head.
3. **Prefer the office with the clearest published email.** Pre-health advising first, then nursing and allied health, then career services.
4. **Tag every office.** The tag is what makes the outreach copy correct later.
5. **Add an advisor only when they have their own contact.** A name with no direct email gives outreach nothing to use.
6. **Tick verified only when you would send to that address today.** The tick is the gate.
7. **Then confirm by a quick call before launching.** Generating a prospect is not the same as knowing the address is live.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Office name · tag · email · phone · website · source link · optional advisors · verified flag · the research links kept	researched → prospect	research started · links kept · office verified · prospects generated · stakeholder added to site	Offices generated	Stays with the Admin Team → ST-OUT , via the Partners tab

Communications None at this stage. The confirming call and the outreach that follows are ST-OUT.

EXHIBITS

Exhibit O. Find partners. The entry point on the site card, alongside the research-progress badges and **See stakeholders** → .
olera.care/admin/medjobs/sites

Exhibit P. Research · step 1, Find offices. Subtype tabs across the top (**Advising** · Student orgs · Departments), the three steps beneath, **Suggest links**, and the predefined searches with **Open all**, an add-by-hand field, and a kept-links list.

Research - University of Illinois Urbana-Champaign

Advising orgs Student orgs Departments

Find offices Verify offices Generate

Saved 3:09:07 PM

The advising office is the prospect. Confirm each one's email and tag — that's all outreach needs. Advisors are optional and only when they have their own contact.

They're in your In-Basket for University of Illinois Urbana-Champaign. Next: confirm each advising office by a quick call, then launch outreach.

Continue to Student orgs See prospects

Exhibit R. Research · step 3, Generate. Confirmation that the offices were created and are waiting in the In Basket, with the next action named (*confirm each advising office by a quick call, then launch outreach*) and **Continue to Student orgs** → .

Exhibit S. Partners tab. The generated offices as prospects, each with its university and tag, above the site cards still needing research. `olera.care/admin/medjobs/in-basket?tab=partner_book`

ST-OUT: UNIVERSITY OUTBOUND

Objective Confirm the advising office by phone, launch the call-and-email campaign, then work the queues it generates until the office books a meeting or the row runs out.

- **Owner** Admin Team.
- **Users** Admin Team, advising office.
- **Completion criteria** A meeting on the Sales Lead's calendar, or a recorded terminal outcome, or a finished cadence that drops the row into Follow-up.

Same machinery, different cadence. ST-OUT runs on the same pre-flight call, the same Calls and Emails queues, and the same log modals as the provider side. What differs is the campaign: the partner cadence is **5 emails and 1 call**, and every email is meeting-first: the ask is a conversation with Dr. DuBose, not a service. Providers get **3 emails and 2 calls**. Nobody should have to remember which; the launch modal states it before anything sends.

① USER JOURNEY / TECHNOLOGY

Actors: Admin Team and the advising office. Confirm, then launch, then work the queues daily.

#	What happens	Where	Exhibit
1	Open the office in the Partners tab. The drawer's RESEARCH panel states the sequence plainly (" <i>Check the info, call to confirm, then launch outreach</i> ") over the office name, general email, general phone, and an ADVISORS list	In Basket → Partners → row	T
2	Call to Confirm. Log Pre-Flight outcome opens with the script and the four outcomes. <i>Confirmed contact info</i> unlocks the row for outreach	Drawer → Call to Confirm	U
3	Launch outreach → Confirm outreach plan lays out the whole campaign: a launch summary, the recipients as checkboxes, and every day expandable to the actual email	Drawer → Launch outreach →	V
4	Start outreach. Day 0 sends; the rest queue, and UPCOMING shows <i>Outreach queued</i> with its date	Automatic	T
5	Work the Calls and Emails tabs daily: the same queues the provider rows sit in	<code>olera.care/admin/medjobs/in-basket</code>	W
6	Check replies. Check for reply quotes their message and offers the ways to respond	Emails → row → Check for reply	W

# What happens	Where	Exhibit
7 A cadence that finishes with no meeting drops the row into Follow-up	In Basket → Follow-up	None

The cadence. Day 0 is the **intro email (meeting-first)**: it names Dr. DuBose, links the flyer and the program PDF, and asks for a conversation with the advisors students turn to. Day 3 is a **one-line bump**. Emails send from [partnerships@findmedjobs.co], a dedicated outreach domain.

Recipients. The general office contact always; any advisor added in ST1 with their own email as a selectable extra, which is why ST1 accepts only advisors who have one. **Launch activation** → sits beside Launch outreach as the second cadence, run once a row has engaged.

② PROCEDURE

1. **Call before you launch.** The row is a prospect, not a confirmed address. The pre-flight call exists to verify the email actually reaches the office and to find the person who decides.
2. **Use the suggested script.** It leads with Dr. DuBose's office, names the program, and asks one thing: the best address to send the details to. Nothing is being sold on this call.
3. **Log the outcome, every time,** including the calls nobody answered. The override writes itself to the timeline with your name on it.
4. **Read the plan before starting.** Expand Day 0 and check the merge fields resolved. A wrong substitution is visible here and nowhere later.
5. **Keep the research notes honest.** The panel says the office was AI-sourced and tells you to confirm by phone. Replace that with what the call established.
6. **Answer every reply within one business day:** same day for anything mentioning a time.
7. **Do not hand-email a row mid-cadence.** Reply through the row so the cadence stops cleanly.
8. **Respect permission gating on professors.** Class visits and listserv posts happen because someone agreed to them; the ask on this cadence is a meeting, not a distribution.

The pre-flight outcomes and the reply options are the same four and five as the provider side (PR1, PR-OUT). One difference: **Launch activation cadence** drops out of the reply options once a row is already enrolled: the timeline then reads "*Activation launched,*" and four choices remain.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Pre-flight call outcome and notes · recipients launched · sends, opens, replies · call outcomes · scheduled sends and calls	prospect → researched → outreach sent → cold · replied · closed · cadence finished	initial contact added · row moved from Prospect to Researched · reached on the phone · pending tasks superseded, stage advanced · outreach queued · outreach email sent (with open state) · reply received, cadence stopped · activation launched	A meeting is booked	Admin Team → Sales Lead. The row appears in the Meetings queue with its full timeline. No meeting and the cadence finishes → the row drops to Follow-up

Communications Pre-flight confirming call · Day 0 intro email (meeting-first) with flyer and program PDF · Day 3 one-line bump · the remaining cadence emails · the cadence call · the reply the office sends back.

EXHIBITS

The screenshot shows the 'MedJobs - In Basket' interface. On the left is a sidebar with navigation options like 'Records', 'Trust & Safety', 'Operations', 'MedJobs', and 'Young Caregivers'. The main area displays a list of entries. The 'ASU Career Services' entry is highlighted. To the right, the 'RESEARCH' section is expanded, showing details for 'ASU Career Services' including office name, general email, and general phone. Below this, there are buttons for 'Call to Confirm', 'Launch outreach', and 'Launch activation'. A 'Research notes' section contains text about sourcing the office. A 'TIMELINE' section shows 'Outreach queued' under 'UPCOMING' and a history of actions under 'PAST ACTIVITY'.

Exhibit T. Partner drawer. RESEARCH states the sequence ("Check the info, call to confirm, then launch outreach") over the office name, general email and general phone, with **ADVISORS (0)** and the rule beneath it: "Anyone with an email becomes a selectable recipient at launch, alongside the general office contact." Three actions: **Call to Confirm** · **Launch outreach** → · **Launch activation** → . **Research notes** records where the office came from. **TIMELINE** shows *Outreach queued* under **UPCOMING**, and the row's history under **PAST ACTIVITY**. olera.care/admin/medjobs/in-basket?tab=partner_book → row

This screenshot shows the same 'MedJobs - In Basket' interface as Exhibit T, but with a modal window open for 'Log Pre-Flight outcome'. The modal is titled 'Log Pre-Flight outcome' and is for 'ASU Career Services - 480.965.2350'. It contains a 'SUGGESTED SCRIPT' section with a pre-filled message. Below this are four radio button options for the outcome: 'Confirmed contact info', 'No answer', 'Voicemail', and 'Not interested'. Each option has a brief description of the consequence. There is also a 'Notes (optional)' field and a 'What did they confirm? Anything useful for outreach copy?' prompt. At the bottom are buttons for 'Override & launch outreach', 'Cancel', and 'Log call'.

Exhibit U. Log Pre-Flight outcome. The **SUGGESTED SCRIPT**: Dr. DuBose's office, the program, and one ask: the best address to send the details to, then the four outcomes with their consequences stated on each, a notes field prompting "What did they confirm? Anything useful for outreach copy?", and **Override & launch outreach** for rows that do not need the call. Partner drawer → **Call to Confirm**

Exhibit V. Confirm outreach plan. LAUNCH SUMMARY reads "5 emails + 1 call across the cadence below." RECIPIENTS (1) lists the general contact with its address and phone. CADENCE opens Day 0, intro email (meeting-first), to the full email: To, From partnerships@findmedjobs.co, the subject, the body the office will actually read, the variables that were substituted, and the program PDF. Day 3 is a one-line bump. Footer reads "5 email + 1 call ready" against Start outreach. Partner drawer → Launch outreach →

Exhibit W. Check for reply, and the Emails tab. The reply quoted at the top, then the ways to respond (Launch custom cadence, OOO reply) restart last cadence, Book a meeting, Not interested. Behind it the Emails tab grouped by state, THEY REPLIED (7) over PENDING REPLY (96), and the drawer's NEXT STEP panel: They replied · [address] over Reply now and Call. The timeline shows the sends, the reply that stopped the cadence, and the activation launch. This queue is shared: provider and partner rows are worked side by side in the same tab with the same modal, which is why the row shown here is a provider. olera.care/admin/medjobs/in-basket?tab=replies → row → Check for reply

ST2: ADVISOR MEETING HELD

Objective Hold the meeting, agree which of the five activation channels are open to us, and hand the Consumer Relations Manager a plan they can act on without asking again.

- **Owner** Sales Lead.
- **Users** Sales Lead, advising office.
- **Completion criteria** Outcome logged, the agreed channels and their named contacts written down, and the relationship handed to the Consumer Relations Manager.

This meeting is not a sale. It is a channel-planning session. The provider meeting ends in a commercial agreement; this one ends in a route to students. The advisor already believes pre-health students want caregiving hours. What we do not know is how their campus reaches them, and the output is the ST3–ST7 plan.

① USER JOURNEY / TECHNOLOGY

#	What happens	Where	Exhibit
1	Someone books the 30-minute slot. Usually the Admin Team does it (live on the confirming call, or from a reply that names a time)	Calendly) Student Caregiver Program	L
2	The booking lands the row in Meetings , under NEEDS LOGGING once the time has passed	olera.care/admin/medjobs/in-basket?tab=meetings	M
3	Hold the meeting and work the five channels	Video	None
4	Log meeting outcome: the same modal and the same three outcomes as the provider side	Row → Log meeting outcome	N

Advisors book the same event as providers: the 30-minute *Student Caregiver Program* slot, one link for both funnels. The invite copy carries over unchanged, which reads acceptably to an advising office; the event slug in the URL does not. See the deferred list.

② PROCEDURE

1. **Read the row before the call.** Advisors notice when you already know what they told the last person.
2. **Open by naming what students get**, not what we want: hours, a letter, and experience that strengthens a med, PA or nursing application. That is the advisor's job, which makes it common ground.
3. **Then work the five channels in order.** This is the body of the meeting.
4. **Ask for their read, not just their permission.** "*Which of these actually reaches pre-health students here?*" An advisor telling you the job board is dead and the listserv is everything saves the Consumer Relations Manager a month.
5. **Get a name for every open channel.** A channel with no named contact is not a channel.
6. **Ask what they need from us to make it easy** (copy, a flyer, a date) then send it within two days.
7. **Log the outcome the same day**, with the channel plan in the notes.

The five channels: what to ask, and what a usable answer looks like

Channel	Ask	The answer the Consumer Relations Manager needs
ST3 University job board	Is there a board pre-health students actually check? Who posts, and does it need approval?	The board, the posting route, and who approves
ST4 Advisor listservs	Do you email these students directly? Would you send something for us?	Which list, who sends it, how often they are willing, and the copy they want
ST5 Student organisations	Which orgs reach these students: pre-med, pre-nursing, AMSA chapters? Who runs them this term?	Org names and current officers, with a warm introduction where they will make one
ST6 Campus events	Which fairs or events are worth attending, and what are the deadlines and costs?	Event, date, registration deadline, who books the table
ST7 Professors and class visits	Which professors teach the courses these students take? Would an introduction be welcome?	Named professors, and explicitly whether we may approach them

Permission is the deliverable on ST4 and ST7. A listserv send and a class visit both happen on someone else's authority. Write down who granted it and what exactly they agreed to, because the User Success Manager will be acting on it weeks later without having been in the room.

Meeting outcomes and what each does to the row

Outcome	What happens
Interested / went well	Logs the meeting and launches the activation sequence
No-show / reschedule	Logs a no-show and opens Calendly to rebook
Not interested	Sends a polite closing note and stops outreach

When the advisor skips the meeting. Some advisors will not take a call. They reply to the outreach by simply telling us what to do: post it here, email this officer, send me copy for the listserv. **Take the advice and act on it.** A channel the advisor handed us is worth more than the meeting that would have produced it. Two things still hold:

1. **Capture it exactly as if it came from a meeting** (channel, named contact, permission) so the User Success Manager inherits the same plan either way.
2. **Keep pushing for the meeting, gently.** Not to unlock the channels; those are already running. A named advisor is what makes the second term easier than the first, and the moment to ask is when you report results back, *here is what your listserv produced. Can we talk about the spring?*

Today the row has nowhere to sit in that state: channels agreed, no meeting held. See the deferred list.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Booked time · attendee · outcome · the channel plan and permissions, as notes · named contacts offered	engaged → meeting scheduled → active partner · closed	meeting scheduled: row moved to Meetings · meeting held · outcome logged · activation launched	Outcome logged	Sales Lead → Consumer Relations Manager. <i>Interested / went well</i> launches activation and hands over the channel plan; the other two close the row

The channel plan is the handoff. It travels as prose in the meeting notes, which is enough to work from and not enough to report on: nothing counts how many campuses opened a listserv, or which channel produced the students who applied. Structured capture is on the deferred list, alongside the attribution it would make possible.

Communications Booking confirmation and reminder from Calendly · the post-meeting note with the ready-to-send copy and flyer the advisor asked for · the results-back note that carries the next ask.

ST3–ST7: UNIVERSITY ACTIVATION

Objective Turn the channel plan agreed in ST2 into five live channels at that university, then keep each one alive.

- **Owner** Consumer Relations Manager, with the Sales Lead where a physician in the room changes the answer.
- **Users** Consumer Relations Manager, advisor, org officers, professors, students.
- **Completion criteria** Every agreed channel is either live and recorded, or explicitly marked as not available at this university: and every live channel has its next maintenance task queued.

This stage does not close. Every stage before it ends in an outcome. Activation ends in a standing commitment: postings expire, officers graduate, a career fair moves, a listserv only sends when someone remembers. **Each channel is two motions (secure it once, then keep it alive)** and the second decides whether a university produces students in the spring as well as the fall.

There is no generic version of this stage. One campus is a dead job board and a listserv that reaches everyone; the next is three student orgs and a professor who will give us ten minutes of a class. The Consumer Relations Manager works the plan per row, not per channel.

① USER JOURNEY / TECHNOLOGY

Channel	Who acts	What the student sees
ST3 University job board	Consumer Relations Manager posts; the advisor or the board's owner approves	A posting on a board they already check
ST4 Advisor listservs	Consumer Relations Manager supplies the copy; the advisor sends it	An email from a sender they already trust
ST5 Student organisations	Consumer Relations Manager builds it; an officer shares it	A post in their group chat, or a mention at a meeting
ST6 Campus events	Consumer Relations Manager and Sales Lead attend	A table, a talk, a QR code
ST7 Professors and class visits	Consumer Relations Manager and Sales Lead, once permitted	An introduction in a class they are sitting in

② PROCEDURE

- 1. Work the plan from ST2, not a template.** The row says which channels are open here and who agreed to each. A channel nobody agreed to is not on your list.
- 2. Activate every agreed channel within two weeks of the meeting.** The advisor is warmest immediately after; a month later you are re-introducing yourself.
- 3. Supply ready-to-send copy for anything a partner sends.** The advisor should have to forward, not write. This is the single largest determinant of whether ST4 actually happens.
- 4. Record the distribution when it happens:** the channel, the date, the asset used, and a rough reach estimate, on the partner row.
- 5. Report results back to the partner.** *Your listserv produced eleven applications.* It is the reason they send the second one, and the natural moment to ask for the next thing.
- 6. Re-check the whole row each term.** A row fully activated in September is not necessarily activated in January.

What securing and maintaining each channel means

Channel	Secured means	Maintaining means	Rhythm
ST3 University job board	The listing is live and visible to students	Check it has not expired or been archived; repost or renew when it has	Every few months
ST4 Advisor listservs	The advisor has agreed to send, and has our copy, and a date is set	Remind the advisor, with fresh copy ready each time. The send happens because we asked	Each agreed send
ST5 Student organisations	An officer has shared it once	Refresh before it goes cold; re-establish with new officers when leadership turns over	Ongoing, and every term
ST6 Campus events	We are registered for a named event on a named date	Confirm it is still scheduled and still our date; rebook when it moves	Before each event, then re-book
ST7 Professors and class visits	A named professor has agreed to an introduction or a visit	Follow up per professor, with a record of who was contacted, who agreed, and which class was visited	Per professor, then per term

ST3, rung by rung. The job board is the one channel the board works as an explicit ladder, because its steps happen days apart and strictly in order.

Rung	Done when	What it records
Research	you have found where an employer submits a posting at this campus	the job board link, and whoever owns it if anyone does
Confirm it is submitted	the listing is with the university	ticks <i>submitted</i>
Confirm it is approved	the listing is on their board	the listing link; ticks <i>approved</i>
Confirm the first student has applied	somebody came through it	ticks <i>visible</i> , which is what turns the channel live
Confirm the listing is still live	seasonally, that a student could still apply	nothing; it is a look

Research comes first because the reason a job board stalls is almost never the posting. It is that nobody knew where the posting goes, and each campus hides that somewhere different. The two middle rungs carry a two-day reminder rather than waiting to be remembered, since approval sits in somebody else's queue.

Decision rules. These are the judgement calls that come up every week. They are settled here so they are not settled differently at each campus.

Situation	Do this
The advisor says the board is dead	Mark ST3 <i>not available here</i> with the reason. Do not post anyway to have something recorded
A send is agreed but no date is named	It is not secured. Secured means a date on the row
Two weeks pass with no reply to your activation email	Send one follow-up. After that, ask the advisor for the introduction rather than chasing
An officer graduates and nobody replaces them	The channel is lapsed , not secured. Re-secure with the new officer or move it back to <i>not yet</i>
A professor has not answered twice	Stop. A third email costs advisor goodwill, which is worth more than one class visit
A channel produced nothing after two distributions	Keep it and say so to the partner. Report the number; do not quietly drop the channel
Anything clinical, or a physician in the room	Bring the Sales Lead in. Do not answer scope-of-practice questions yourself

The asks, ready to send. Each is short on purpose: a partner who has to edit is a partner who does not send.

- **ST3 posting.** Title, one paragraph on the work, pay range, the apply link, and a named contact. Nothing that reads like an advertisement.
- **ST4 officer.** *We work with your career office. Would you share one post with your members about paid caregiving shifts that fit around class? I will send it written and ready.*
- **ST6 forward copy.** Subject line, three sentences, and the link, written so the advisor forwards it unedited under their own name. Never a PDF only.
- **ST7 professor.** *[Advisor] suggested I write. Would ten minutes at the start or end of a class be welcome, or would you rather I send something for your course page? Always name the advisor, and always offer the smaller option.*
- **ST5 table.** Registration deadline, cost, who staffs it, the flyer with the QR code, and who logs the scans afterwards. Booked is not the same as staffed.

ST7 is its own workstream. Professor outreach behaves less like a channel than like a second, smaller outreach funnel: named professors, a permission state on each, an email to follow up, a class visit to schedule once someone says yes. Scoped separately when we get to it; named here so it is not mistaken for a checkbox.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Per channel: secured / not yet / not available · named contact · date live · next check date · distribution date, asset used and reach estimate	partner active → distributing → maintained	channel activated · distribution recorded · maintenance task completed · channel lapsed	A student follows the link	→ Portal (ST8). The partner row stays open and keeps producing

What the system has to do. None of this is built. It is specified here so it can be built rather than re-argued, and it is four things, not one.

Build	What it is	Why this stage needs it
B9 The advisor follow-up tab	The five channels as a checklist on the partner row: <i>secured, not yet, not available here</i> , each with named contact and go-live date	A university's whole activation state in one glance, and answerable across universities: <i>which campuses have a live listserv?</i>
B10 Self-queueing maintenance	Checking a channel off writes its next check date into the same daily queues the Admin Team already works	A channel stays alive only as long as someone remembers it. This is what stops remembering being the system

Build	What it is	Why this stage needs it
B11 The professor record	Named professors under a campus, a permission state on each, the follow-up and the class visit it produced	ST7 has no home today. Without it, professor outreach is invisible and unrepeatable
B12 Channel attribution	Which of the five produced a student, carried on the application	Until it exists, the five channels cannot be told apart by results, only by effort

Everything above B12 is effort, not outcome. Until attribution ships, a campus that activated all five channels and a campus that activated one look identical in the numbers. Say so when reporting rather than implying the ranking means more than it does.

Worked example: Ohio State. ST2 agreed the advisor would send to the pre-health listserv, that the job board is worth posting to, and that two orgs are worth approaching. The row after activation reads: **ST3 secured**, posted 14 September, next check 15 December. **ST6 secured**, advisor Dana Whitfield, first send 21 September, reach about 900, second send agreed for January. **ST4 partial**, AMSA chapter shared it on 2 October, pre-nursing society *not yet*, officer elections in November. **ST5 not yet**, spring health careers fair, registration opens 1 November, that date on the row now. **ST7 not available here**, the advisor asked us not to approach faculty this term, recorded with the reason so nobody tries again in March. Four of five moving, one closed with a reason, and every one of them carrying a date.

Every other stage hands a row on and lets it go. This one keeps it. The Consumer Relations Manager's working state is the set of partner rows with live channels and the date each is next due, which is why the follow-up tab and its queued tasks are the difference between five universities and fifty.

Communications Ready-to-send copy per channel · the flyer as the shared asset · the listserv reminder to the advisor · the results-back note · the professor email sequence.

ST8: STUDENT APPLICATION SUBMITTED

Objective Carry a student from the QR code on a flyer to a live application, without anyone in the middle.

- **Owner** Portal.
- **Users** Student, Consumer Relations Manager only when the system cannot finish the job.
- **Completion criteria** The student is live: visible on the board, and the providers in their catchment have been told they are ready to interview.

This stage should run itself. Every other stage is an operator working a queue. This one is a student alone with a website at eleven at night. The system screens them, takes the application, chases what they left blank, decides when they are ready, and tells the providers. The Consumer Relations Manager is here for what the system cannot resolve, not as a step in the flow.

The assets below are final in form, not in content. All five work end to end and are shown here as the shipped journey. Every one needs another pass, and the journey needs a QA sweep from both entry points. See the deferred list.

① USER JOURNEY / TECHNOLOGY

#	What happens	Where	Exhibit
1	The student sees the flyer (on a board, in a listserv email, at a table) and scans the QR code	Print and PDF, ST3–ST7	X
2	It lands them on the student page, and the eligibility check opens on top of it: 2 <i>quick questions</i> , starting with "Where are you headed?": Med school · Nursing · PA · PT/OT · Public health · Still exploring	olera.care/medjobs/families	Y
3	They read the Student Caregiver Program Agreement (what the program is, who employs them, the one-time \$50 fee, the term commitment) and accept it on signing up	Linked from the landing page	Z
4	Signed in, they land on the board: Recommended for you , filtered by campus and care type, every card gated behind Complete profile to apply	olera.care/portal/medjobs/jobs	AA
5	They work the application (availability, commitment, screening questions, experience, documents) against a Profile completeness meter that names every remaining section	olera.care/portal/medjobs	AB
6	The system chases what they left blank on a fixed ladder of nudges	Automatic: daily cron	None

# What happens	Where	Exhibit
7 Once the baseline is met, they Go Live	Portal → Go Live	AB

The baseline for going live. The point at which an application is worth a provider's time: **an intro video · a driver's licence · car insurance · their weekly availability · their answers to the screening questions.** The first three live in the profile's Verification section, the other two in sections of their own.

Everything else on the profile makes a student more attractive to a provider. These five are what make them assessable at all. **The list is a starting position and should be revisited** once we see which parts providers actually use to decide who to interview.

Nothing is required to go live today. The Go Live review lists unfinished sections under "*Recommended but not required*," and excludes the verification section entirely, which is where the video, the licence and the insurance sit. A student can go live at 5%. The baseline above is the intent; enforcing it is on the deferred list.

How the operator sees the same student. Once a student is on a partner campus, they also appear on the Tasks board under that university, on a five-rung ladder ending in a hire. Three of the five are not work at all: they are facts this stage and the two after it already record, and the board reads them rather than asking anybody to confirm them.

Rung	Who answers it	From what
Meeting with the student	the operator	nothing records it, so somebody has to
Complete their application	the system	going live
Get them an interview	the system	an interview on the calendar
Confirm hire	the system	a placement accepted
Confirm hours worked	the operator	the student, monthly

Order stops mattering as a result. Most students finish their own application without anybody chasing them, and the ladder no longer assumes the meeting came first. A finished application answers its own rung and leaves the meeting to do; an interview or a hire says the earlier rungs happened one way or another, so a student already hired is never queued for an introductory call.

A rung the system answers is shown as done, never as work. It sits in its own band on the record, saying who answered it, so the difference between *nobody needs to chase this* and *somebody chased it* is never lost.

What going live does. Two things, and the second one is already built:

1. **The student becomes visible:** active on the board, matchable by providers in their area.
2. **Every provider we are actively working in that student's campus catchment is emailed** that a new candidate is ready to interview. This fires on the **first** go-live only, runs in the background so a failure can never block the student, and is capped so a single go-live cannot blast an entire catchment.

That second one is where this stage runs into QUAL. Going live *is* the qualification event as the system currently behaves: the broadcast says the candidate is ready, and nobody decided that. Whether that is right is QUAL's question, not this stage's. See that stage and the deferred list.

② PROCEDURE

Deliberately short. If this list grows, the system has failed.

1. **Watch the stall, not the student.** The ladder handles the individual; what needs attention is the pattern. A campus where half the applications stop at the same section is a broken question or a broken upload, not eight unmotivated students.
2. **Log why students stall**, so the pattern is visible at all.
3. **Intervene by hand only when the system cannot:** a document that will not upload, a student whose circumstances do not fit the form.
4. **Check both entry paths after any change to the assets.** The QR code and the email link must each carry a student all the way through.

The nudge ladder: built and running. A daily job emails every student under 100% completeness, naming what they are missing, on a fixed schedule: **days 1, 3, 5, 7, then 21, 35, 49, 63**, eight nudges over roughly six

weeks, then it stops. It will not send twice within twenty hours.

The ladder measures a different thing than Go Live does. It treats **100% completeness** as done and sends *"Your MedJobs profile is live!"* at that point, while the button that actually makes a student live requires nothing at all. So a student can be live on the board at 5% and still be told their profile is incomplete, or reach 100%, be told they are live, never press Go Live, and have no provider hear about them. Two definitions of *live*, disagreeing. On the deferred list.

The completeness ladder. Four nudges in the first week, four more over the following six, then silence.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Eligibility answers · agreement acceptance · availability and commitment · screening answers · experience, certifications, skills, resume · verification documents and expiries · completeness per section	started → in progress → live	student eligibility completed · application started · nudge sent · profile activated · catchment providers notified	Go Live	→ QUAL. The student appears on the board and the catchment hears about them

Nothing here records **how the student found us**: which flyer, which listserv, which class visit. Until it does, ST3–ST7 cannot be told apart from each other by results, only by effort.

Communications Welcome and account-created emails · the profile-incomplete nudge ladder · the activation email · the candidate-ready broadcast to catchment providers.

Olera's Student Caregiver Program

A paid Student Caregiver Program for pre-nursing and pre-medical students

Get paid for real caregiving experience that strengthens your health-school application.

Olera matches pre-health students and gap-year applicants with local home care agencies as paid caregivers. You get the hands-on patient-care experience that medical, nursing, PA, and other professional schools look for — plus mentorship, references, and a recommendation letter — on a schedule that works around your classes. Agencies near you are hiring student caregivers now.

WHY STUDENTS JOIN

Get paid

Earn an hourly wage for meaningful work — a real job, not a volunteer gig.

References + a recommendation letter

Build a record from people who watched you work, plus real stories for your personal statement and interviews.

Healthcare experience that counts

Hands-on patient-care experience — exactly what medical, nursing, PA, and other professional schools look for.

Coaching from Dr. DuBose's team

Mentorship, mock interviews, and help with your letters and personal statement — included, around your class schedule.

HOW TO JOIN

01

Check your eligibility in a few minutes.

02

Apply, get screened, and on-board.

03

Get matched with a local home care agency that needs caregivers.

04

Start your shifts and start earning.

WHO CAN JOIN

- Open to any pre-health major — current students and gap-year applicants.
- No prior experience required.
- Your employer provides training for the role.
- Background check handled as part of onboarding.

WHAT TO EXPECT

Paid hourly · flexible hours · one-time \$50 to join

A one-time, non-refundable \$50 application fee gives you lifetime access to the Olera job board and includes mentorship, mock interviews, and help with your letters and personal statement from Dr. DuBose's team. You choose how much you work, around your classes.

Dr. Logan DuBose, MD, MBA
Texas A&M College of Medicine '22
NIH-funded researcher
Director, Olera Student Caregiver Program

Graize Belandres
Assistant to
Dr. Logan DuBose
graize@olera.care

Exhibit X. The flyer. The asset every activation channel shares: what the student gets, the four-step *How to join*, who can join, the one-time \$50 fee, and the **QR code** that starts the whole funnel.

Exhibit Y. Landing page and eligibility check. "Get real healthcare experience: paid caregiving jobs for college students pursuing careers in medicine and nursing," with **Apply Now** and the jobs board beneath. Over it, **ELIGIBILITY CHECK · 2 QUICK QUESTIONS:** "Where are you headed?", which routes the student and captures their track before anything else is asked of them.

olera.care/medjobs/families

Olera Student Caregiver Program Agreement

This agreement explains how the Olera Student Caregiver Program works and what you agree to when you join. It is written for you, the student. Please read it before you start.

What the program is

Olera matches pre-health students with local home care agencies for paid caregiving work. You get real, paid experience caring for older adults — the kind of hands-on healthcare experience that medical, nursing, PA, and other professional schools look for — plus mentorship, references, and a recommendation letter for your applications. The program is built as much for students in a gap year as for those currently enrolled.

The agency you work for is your employer. Olera makes the match and supports you along the way; Olera does not employ, pay, or train you for the role — your employer does.

How it works, step by step

1. You apply and join. You can join if you are pursuing a health career and want real patient-care experience, whether you are currently enrolled or in a gap year. When you join, you pay a one-time \$50 application fee and confirm that you qualify.

The fee is non-refundable, and it is the only fee you ever pay Olera. It gives you lifetime access to the Olera job board, where local providers post caregiver openings, and it includes the application support described below.

2. You get matched and accept an offer. Olera matches you with local home care agencies looking for caregivers, and you can browse openings on the job board. You can talk with an agency before you decide. When one wants to bring you on, they make you an offer. You choose the offer you want and accept it. You are never required to accept one.

3. You get ready before your first shift. Before you start, you finish your profile and upload any documents we ask for, such as proof of certifications. Your employer provides any training you need for the role. You agree to complete these steps before your first shift. This keeps you and the people you care for safe.

4. You commit to the term and work your shifts. You commit to one academic term at a time. Your classes come first, and Olera sets that expectation with every employer up front, so they know your availability works around your course schedule. In return, you take the commitment seriously.

The agency is your employer. They set your schedule within your availability, pay you through their payroll, and supervise your work. Olera does not set your pay and does not pay you.

While you are in the program, you agree to:

- keep your availability up to date — the hours you can work outside of class — and submit it so your employer can schedule you
- be flexible and reliable within those hours, including during midterms and finals, and give early notice if your plans change
- show up on time, and only do tasks you have been trained for

Exhibit Z. Student Caregiver Program Agreement. In plain language: what the program is, that **the agency is their employer and Olera is not**, the \$50 fee and what it buys, how matching and offers work, what they must finish before a first shift, and the one-term commitment. Footed "Draft for review. Not legally binding yet."

Exhibit AA. The job board. Recommended for you ("based on your profile, these are the best matches near you") with campus and care-type filters, a map, and a running job count. Every card and the banner above them say the same thing: **Complete profile to apply.** olera.care/portal/medjobs/jobs

Exhibit AB. The application portal. The student's profile, section by section, each with its empty state and edit control. On the right, **Not live yet** over the **Go Live** button, and **Profile completeness**: a percentage, a stage label, and every section scored from Profile Overview through Verification. olera.care/portal/medjobs

QUAL: PORTAL VETS THE APPLICATION

Objective Turn a completed application into a qualified candidate, and put that candidate in front of the providers who can hire them, from both directions at once.

- **Owner Portal.**
- **Users** Student, providers in the student's catchment, Consumer Relations Manager on exceptions.
- **Completion criteria** The student is on the board, every hiring provider in their area has been told they are ready to interview, and the student has been given the list and the phone numbers to call them.

Qualification happens at go-live, whether or not anyone decided it. The moment a student presses Go Live, the system tells providers a candidate is *ready to interview*. That is a qualification claim made under our name with no criteria behind it. Everything below describes the stage as it should work; the criteria are the missing piece the rest of it hangs on.

① USER JOURNEY / TECHNOLOGY

# What happens	Where	Exhibit
1 The student goes live	Portal → Go Live	AB
2 They appear on the board: matchable, filterable by campus and care type, visible to providers looking for student caregivers	olera.care/portal/medjobs/jobs	AA
3 Every provider we are working in that student's campus catchment is emailed, "Ready for interview: a student caregiver candidate near [campus]", with a link to the profile	Automatic, on first go-live	None
4 The student is emailed the providers who are hiring near them, with phone numbers, and told to call	Not built	None
5 Providers start hearing from students who have met our bar	Phone	None

Both directions matter, and only one of them is built.

Direction	What it is	Where it stands
Us → providers	On first go-live, providers being actively worked in the student's campus catchment get a <i>candidate is ready to interview</i> , with a link to the profile. Runs in the background so a failure never blocks the student, and is capped so one go-live cannot blast a whole catchment	Built and running
Us → student	A list of every provider hiring near them (name, area, and the phone number) and a clear instruction: call them, tell them you are available to interview	Not built. This is the important half

The student calling is the point. A provider who receives an email about a candidate may open it. A provider who picks up the phone to a student saying "I'm in the Student Caregiver Program, I'm cleared to interview, are you hiring?" has met the candidate. The first is a notification; the second is a placement starting.

What exists today is a near-miss. A student-facing email already fires when a *provider* accepts terms, telling live students "a caregiver job near you is open." Right idea, pointed the wrong way: triggered by the provider rather than the student qualifying, one provider rather than the list, and a link to click rather than a number to call.

② PROCEDURE

Deliberately short, for the same reason as ST8: this stage should be a system, not a queue.

1. **Handle exceptions, not cases.** A student the rules would reject who is obviously right, or the reverse. Record the reason for every override.
2. **Feed failure reasons back into the application.** A criterion that keeps failing honest applicants is a badly written criterion.
3. **Watch what happens after the list goes out:** whether students actually call, and what providers say when they do. That is the fastest signal we have about whether our bar means anything.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Criteria evaluated · decision and reason · reviewer on an override · which providers were notified · the call list sent to the student	submitted → qualified · not qualified	qualification decision · profile activated · catchment providers notified · call list sent to student	Qualified and both broadcasts sent	→ MA1 . The candidate is live, the providers know, and the student is calling

Communications The candidate-ready email to catchment providers · **the call list to the student: hiring providers near them with phone numbers** · the outcome message and what to expect next.

EXHIBITS

Both surfaces this stage produces are shown under ST8: **AB** for Go Live, and **AA** for the board the student appears on.

MA1: CANDIDATE INTRO

Objective Put a qualified candidate in front of the providers who can hire them, in a form a provider will actually open, and keep telling the student where the work is until they are hired.

- **Owner** Portal, Consumer Relations Manager on exceptions.
- **Users** Provider, student.
- **Completion criteria** The provider has seen the candidate, and the student knows who is hiring and how to reach them.

Assume nobody logs in. A provider will not create an account to look at a candidate, and a student will not check a job board every day waiting for work to appear. Everything in this stage has to land in an inbox or on a phone and be usable there.

① USER JOURNEY / TECHNOLOGY

To the provider: the candidate, as an attachment. The intro email carries **the candidate's profile as a PDF** as well as a link. The PDF is the point: it opens on a phone, forwards to whoever does the hiring, and needs no login. Our send path already supports attachments, it sends calendar files that way today, so this is a renderer and a template change, not new infrastructure.

To the student: three channels, and the board is the least of them.

	Channel	What it carries	Why it matters
1	SMS	A link to the opportunity, or the profile PDF	The one channel a student reads within the hour. The most important of the three
2	Email	The fuller message: who is hiring, where, what the role is	Carries detail SMS cannot, and survives being read later
3	The phone	The student calling providers directly, off the QUAL call list	The most effective of all, and the one we most under-support
None	The job board	Everything, browsable	Real and worth having, but a display surface. Most students will not go looking

An SMS stack already exists (consent handling, quiet hours, a send queue and a flush job) so student SMS is consent capture and message types on a running pipeline, not a new channel.

② PROCEDURE

1. **Send to the provider in the form they will open:** PDF attached, link included, no login asked for.
2. **Do not rely on the board.** If a qualified student has not been introduced anywhere this week, that is a push we failed to send, not a student who failed to look.
3. **Watch the students who are qualified and not yet hired.** That list is the whole job at this stage.
4. **Keep the call list current.** A student calling a provider who is no longer hiring wastes the one thing we are trying to build.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Which providers were sent which candidate · PDF generated and attached · SMS and email sends to the student · opens and replies	qualified → introduced	candidate intro sent · profile PDF generated · student notified by SMS and email	An interview is requested	→ MA2

Communications Candidate intro email to the provider, PDF attached · student SMS with the link or PDF · student email with the detail · the QUAL call list behind the student's own calls.

MA2: INTERVIEW HELD

Objective Get a real interview onto two real calendars, then confirm it happened.

- **Owner** Portal.
- **Users** Student, provider, Consumer Relations Manager on exceptions.
- **Completion criteria** Both sides firm, a calendar invite on both calendars, and a recorded answer to *did it happen?*

Also from confirmed:

The key endpoint is the calendar invite. Everything before it is scheduling admin; everything after depends on it. When both parties are firm an invite should appear on both calendars, and when its time has passed both should be asked whether the meeting happened. That answer is the instrumentation the whole match half of the funnel runs on.

Interview states. Two of the three ways out of confirmed are failures worth recording.

① USER JOURNEY / TECHNOLOGY

Requests go both ways, and both are built.

#	What happens	Where	Exhibit
1	The student opens a provider's opportunity page and clicks Request interview	Provider page · <code>?ctx=medjobs-student</code>	AC
2	Request an interview: format (Video · Phone · In person), a date and time, Offer another time , and a note to introduce themselves	Same page	AC
3	Providers can request an interview of a candidate the same way, from the other direction	Provider surfaces	None
4	The request emails the other party as proposed , and lands on the student's Interviews calendar as Pending	<code>olera.care/portal/medjobs/interviews</code>	AD, AE
5	On confirmation, both parties are emailed and a calendar file is attached to each	Automatic	None
6	The interview happens	Video, phone, or on site	None
7	Both sides are asked whether it happened. Not built	None	None

What is already there. The loop runs end to end: interviews carry a state machine, *proposed · confirmed · completed · cancelled · no-show · rescheduled*, proposals email the other side, confirmations email both sides, and a calendar file is attached on confirmation. The student's calendar colour-codes **Confirmed · Pending · Past**.

What is missing is narrower than it looks.

What we want	Where it stands
1 A real Google Calendar event on both calendars when both are firm: one both sides can see, update and cancel	A calendar file is attached to the confirmation email. Enough for an RSVP, not a shared event
2 The did-it-happen loop : after the scheduled time, email both sides and record the answer	Not built. <code>completed</code> and <code>no_show</code> exist as states and nothing sets them

② PROCEDURE

1. **Chase the proposal that has sat unanswered.** A pending request nobody confirmed is the single most common place a match dies.
2. **Confirm by hand when a provider will not use the system,** and put the invite on the calendar anyway.
3. **Ask the student first** whether the interview happened. They answer faster, and it is their outcome.
4. **Record a no-show as a no-show.** It is a different problem from a hire that did not happen, and only one of them is the student's.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Format, proposed times, notes · who proposed and who confirmed · the calendar invite · the answer to <i>did it happen</i>	proposed → confirmed → completed · cancelled · no-show · rescheduled	interview proposed · interview confirmed · invite sent · interview completed · no-show	Interview confirmed held	→ MA3

Communications Proposal email to the other party · confirmation email to both, with the invite · reminder before the interview · **the did-it-happen email to both sides afterwards.**

EXHIBITS

The screenshot shows a web browser displaying the Olera website. A modal window titled "Request an interview" is open, allowing a user to request a time to speak with Oak Leaf Manor. The modal includes a "Format" section with radio buttons for "Video", "Phone", and "In person". Below this are "Date" and "Time" selection fields, each with a "Select" button and a dropdown arrow. There is also a link to "Offer another time". A "Notes (optional)" section contains a text input field with placeholder text: "Introduce yourself briefly or mention what interests you about this role...". At the bottom of the modal is a button labeled "Request interview with Oak". The background page shows the "Oak Leaf Manor" profile, including a photo of the facility, a 4.5-star rating, and a description of the "Student Caregiver - Senior living support" role. The page also lists "About this opportunity" and "About this provider" sections.

Exhibit AC. Request an interview. From the student's side, on the provider's opportunity page. **Format** (Video · Phone · In person), a date and time with **Offer another time**, and an optional note. Behind it the opportunity itself: what you'd do, when, and "Counts toward your 120 patient-care hours." `olera.care/provider/...?ctx=medjobs-student`

Exhibit AD. The student's interview calendar, empty. The month grid and the legend that carries the whole state model: **Confirmed** · **Pending** · **Past**. olera.care/portal/medjobs/interviews

Exhibit AE. The same calendar after a request. The requested interview sits on its date (Oak, 8:30a) in the amber of **Pending**, waiting on the provider to confirm. This is the state the follow-up in the SOP above is chasing.

MA3: HIRE CONFIRMED

Objective Find out whether the interview produced a job, and if it did not, find out why.

- **Owner** Consumer Relations Manager.
- **Users** Student, provider.
- **Completion criteria** A recorded answer either way, with a reason when the answer is no.

A hire we did not hear about is a hire we cannot bill for. This stage exists because nobody tells us on their own. The provider hires and moves on; the student starts work and moves on. Every placement we know about is one we went and asked for.

① USER JOURNEY / TECHNOLOGY

Nothing is built. What should run, after the interview:

#	What happens	Channel
1	A cadence opens on the student : did the interview happen, and did they offer you the job?	SMS first, then email
2	If the student does not answer, it becomes a call task in the daily queue	Phone
3	The provider is emailed the same question, more lightly	Email
4	The answer is recorded against the placement, with a reason when it is no	None

Ask the student first, every time. They reply faster and it is their outcome.

Instrument the no. A hire that did not happen is the most useful signal in the funnel: the interview was a formality, the schedule did not work, the student went quiet, the provider was not really hiring. Without a reason field, this stage produces a number nobody can act on.

② PROCEDURE

1. **Open the cadence the day after the interview**, while both sides still remember it.
2. **Student first, by SMS.** One question, answerable in four words.
3. **Escalate to a call** when two touches go unanswered.
4. **Ask the provider once**, by email, and do not chase them further: the monthly list call picks up what they did not answer.
5. **Record the reason for every no.** A blank reason is a lost lesson.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Interview outcome · hired or not · start date · the reason when not · which channel got the answer	interviewed → hired · not hired	hire confirmed · hire not confirmed with reason	Hire confirmed	→ MA4

Communications Post-interview SMS to the student · follow-up email · the call task when neither lands · a single email to the provider.

MA4: SIX OR MORE SHIFTS WORKED, CONFIRMED

Objective Establish that the placement actually stuck, six shifts worked, because that is the point we bill.

- **Owner** Consumer Relations Manager.
- **Users** Student, provider on the monthly list call.
- **Completion criteria** Six shifts confirmed and recorded against the placement.

Chase the student, not the provider. The student knows what they worked and answers a text. The provider is the customer, and asking them to do our record-keeping every week is how we become annoying before we become useful.

The fulfilment chain. Every stage before MA4 is unpaid work; the six-shift confirmation is what releases the invoice.

① USER JOURNEY / TECHNOLOGY

Two ways to get this number, and they are not equally likely to work. **Comms**, SMS and email on a rhythm until the answer is six, asks the student to reply to a text. **Logging**, a place in the portal to log shifts as they go, asks them to remember, every time.

Comms first. A logging surface is more precise and worth building eventually, but a text a student answers beats a form they do not fill in. SMS is the channel, on the same stack as MA1 and MA3.

The provider side is a list, not a cadence. Monthly or quarterly, the Consumer Relations Manager runs the client's students down on a call: still working, how many shifts, any problems. One conversation confirms what a dozen emails would not, and it is a touchpoint rather than an interruption. It is the same call that keeps MA3 honest.

② PROCEDURE

1. **Text the student on a rhythm** from their start date until the answer reaches six.
2. **Never ask the provider week to week.** Their confirmation comes on the list call.
3. **Run the list call monthly per client:** every student placed with them, top to bottom.
4. **Record the confirmation and where it came from:** the student, the provider, or both.
5. **Escalate a placement that stalls before six.** A student who stopped after two shifts is a problem worth understanding while it is still fixable.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Shifts worked and the date each was confirmed · who confirmed it · the list-call record per client	hired → working → threshold met	shift count updated · six shifts confirmed	Six confirmed	→ MA5

Today there is no concept of a shift anywhere in the product. The only trace of the threshold is the number behind the guarantee.

Communications Student SMS on a rhythm · the same question by email · the monthly client list call.

MA5: BILL ISSUED AND COLLECTED

Objective Turn a confirmed placement into an invoice, and the invoice into money.

- **Owner** Consumer Relations Manager.
- **Users** Client.
- **Completion criteria** Invoice issued against a confirmed six-shift placement, and payment recorded.

Manual first, deliberately. At current volume the Consumer Relations Manager raising an invoice by hand is not a stopgap: it is the right answer, and it is how we learn what the automated version should do.

① USER JOURNEY / TECHNOLOGY

#	What happens	Now	Eventually
1	Six shifts are confirmed in MA4	Recorded by hand	Recorded against the placement
2	The bill is raised	The Consumer Relations Manager raises it	A button on the client record: confirm the student hit six, and the invoice issues
3	The invoice is sent and tracked	By hand	Against the client, with its status
4	Payment is recorded	By hand	Automatically, against the placement

Where the button lives. On the client record described in PR3 and still unbuilt. That record already needs to hold every meeting, hire, interview and six-shift confirmation for a client, so the invoice belongs on it too. Build it, and MA5 becomes one click on a row that already exists: the confirmation is the trigger, the invoice the consequence, and the team is there only for exceptions.

② PROCEDURE

1. **Raise the invoice as soon as six is confirmed,** not on a billing day. The confirmation is the event.
2. **Bill against the placement, not the client:** one invoice per student, so a dispute is about one student.

3. **Record payment where the placement lives**, so the client record stays the single account of what happened.
4. **Raise a billing question on the monthly list call**, not by email. The call already exists.

③ SYSTEM / HANDOFF

Data captured	Status	Events	Next trigger	Handoff
Placement billed · amount · invoice issued and sent · payment received	threshold met → invoiced → paid	invoice issued · payment recorded	Payment recorded	Complete. The client record carries the history

Two legacy billing paths exist in the product, neither matching this model, and the Stripe path for placements is stubbed.

Communications Invoice · receipt · payment reminder · the billing conversation on the list call.

DEFERRED BUILD LIST

Things this document describes as they **should** work, which do not work that way yet. Collected here rather than softened in the stages above, so the map reads as the operating system we are building toward and the gap stays visible.

#	Stage	What we want	Where it stands
B1	PR2	The Meetings tab holds only booked meetings. Timing back-and-forth belongs with the email work	<i>Finding a time</i> is a hand-set state inside Meetings. Works, but muddies the tab
B2	PR2	A no-show re-enters outreach automatically. A missed meeting is not a decline	The outcome opens Calendly to rebook. Nothing catches the row if the rebook never happens
B3	PR-OUT PR2	A custom campaign any operator can launch on a single row: pick the emails and calls, set the days, start it	<i>Launch custom cadence</i> exists in the reply modal, not as a general action from a row
B4	PR3	An alert when a meeting converts, putting the client in front of the Consumer Relations Manager with the meeting notes attached	Not built. Nothing tells them a provider is waiting
B5	PR3	The client record. One place holding everything after conversion: notes on every touchpoint, plus the interviews, hires, six-shift confirmations and invoices against that client. The most blocked item here: PR3, MA4 and MA5 all wait on it	Not built. An MVP, notes and a timeline, would carry the stage
B6	ST2	Structured channel capture at the meeting: which channels were agreed, the named contact for each, the permission granted, as fields rather than prose	The plan lives in the meeting notes. Workable for one operator, unreportable across campuses
B7	ST2	A state for channels agreed, no meeting yet, carrying an open ask for a relationship meeting	No such state. The row either sits in Meetings without a meeting or looks like one that never engaged
B8	ST2	A partner-facing booking event	Advisors book the provider's event; the slug <code>home-care-agency-manager-interview</code> shows in the URL they click
B9	ST3–ST7	The advisor follow-up tab. The five channels as a checklist on the partner row (secured, not yet, or not available here) each with its contact and go-live date	Not built. Activation state lives in meeting notes and in the Consumer Relations Manager's head
B10	ST3–ST7	Maintenance tasks that queue themselves: the board re-check, the listserv reminder, the event date, the officer refresh each term	Not built. A channel stays alive only as long as someone remembers it
B11	ST3–ST7	A professor record for ST7: named professors, a permission state on each, the follow-up and the class visit it produced	Not built. Scoped in ST3–ST7, and named separately so it is not mistaken for one more channel
B12	ST3–ST7	Channel attribution. Which of the five produced a student	Channels are not modelled as distinct entities
B13	ST8	A content pass over every student-facing asset, with real empty states, and a check that the portal asks for what we want	All five ship and work end to end. None has had a content pass
B14	ST8	Entry-path QA, from the QR code and from email. Each must carry a student to a submitted application with no dead end, on a phone as well as a laptop	Untested as a journey. The pieces work individually
B15	ST8	A defined and enforced go-live baseline (video, licence, insurance, availability, screening answers) the list to be revisited once we see what providers use to decide	Nothing is required. The review calls everything <i>"recommended but not required"</i> and skips verification, where three of the five sit
B16	ST8	One definition of live	Two, disagreeing. A student can be live at 5% and still be nudged, or reach 100%, be told they are live, and have had no provider told about them
B17	ST8	Application source capture. Ask a student how they heard about MedJobs	Nothing records it

#	Stage	What we want	Where it stands
B18	QUAL	The call list to the student. On qualifying, every provider hiring near them (name, area, phone number) and an instruction to call	Not built. The nearest thing fires when a <i>provider</i> accepts terms, names one provider, and offers a link rather than a number
B19	QUAL	Written qualification criteria , then a step that applies them. The catchment broadcast already calls a candidate <i>ready to interview</i> , under our name	Today "live" means the student pressed a button. Nothing is required and nothing is checked
B20	MA1	The candidate profile as a PDF on the intro email , readable on a phone and forwardable without an account. The link stays alongside it	Not built. The send path already supports attachments: it sends calendar files that way today
B21	MA1	Student SMS. Qualified students who are not yet hired need a push, not a board	Not built for students. The SMS stack exists: consent, quiet hours, a queue and a flush job
B22	MA2	A real calendar event when both sides are firm , updatable and cancellable by either	A calendar file is attached to the confirmation email. Enough to RSVP, not a shared event
B23	MA2	The did-it-happen loop. Ask both sides after the scheduled time and record the answer. The instrumentation the whole match half depends on	Not built. <code>completed</code> and <code>no_show</code> exist as states and nothing ever sets them
B24	MA3	A post-interview cadence to confirm the hire: student first by SMS, escalating to a call task, one email to the provider	Not built. Nothing asks, so nothing is known
B25	MA3	A reason recorded on every hire that did not happen	The most useful signal in the funnel, uncollected
B26	MA4	A shift-count rhythm to the student by SMS , from their start date until the answer reaches six	Not built. Comms before a logging surface: a text they answer beats a form they do not
B27	MA3 MA4	The monthly client list call. Every student placed with a client, run top to bottom. Providers confirm here rather than in a cadence	A practice to establish, not code. Needs B5 to run from
B28	MA4	A shift count on the placement, and a view of who is approaching six	No concept of a shift exists in the product. The only trace of the threshold is the number behind the guarantee
B29	MA5	Billing on the six-shift trigger: a button on the client record that confirms the threshold, issues the invoice and records payment. Manual until volume justifies it	Two legacy billing paths, neither matching the model, and the placements Stripe path is stubbed. Needs B5

How to use this list. Nothing here blocks running the operating system by hand today. Each item is a place where a person is doing something the system should do, or where the system records something less precisely than the model needs. Scope and prioritise them together, against the whole map, rather than one at a time as they surface.
